
MATTEO BAIGUINI

"The technology is my passion", "I love to develop" and things like these can be said by anyone. But just few of them are really going deeper into a technology, to understand really how it does work.

This is how I am: analysing the requirements, searching the best technology to achieve the objective, studying and finally implementing a high-quality solution.

In my philosophy these steps are all equally important. If you don't understand the problem, you are not able to recognise the best technology to solve it. If you don't find the technology, the solution will be wrong and the quality poor.

Of course everything done in strong collaboration with all other team members, because every question and point of view is interesting and gives a bit of improvement.

Keeping this in mind, I am always available to learn something, to try alternative solutions, to suggest something different.

"Make the impossible possible, the possible easy and the easy elegant"
[Dr Moshe Feldenkrais]
