
MATTEO BAIGUINI

Anyone can say "The technology is my passion", "I love to develop" and things like these. But just few are going deeper into a technology, to understand how it does really work.

This is how I am: analysing the requirements, searching the best technology to achieve objectives, studying and finally implementing a high-quality solution.

In my philosophy these steps are all equally important. If you don't understand the problem, you are not able to recognise the best technology to solve it. If you don't find the right technology, the solution will be wrong and the quality poor.

Of course everything done in strong collaboration with all other team members, because every question and point of view are interesting and give always a bit of improvement.

Keeping this in mind, I am always happy to learn something new, to try alternative solutions, to suggest something different.

"Make the impossible possible, the possible easy and the easy elegant"

[Dr Moshe Feldenkrais]
